

SMOOTH, REFRESHED, & TIMELESS

The Gold Standard for Softening Lines & Wrinkles (Traditional or Microbotox)

What is a Neurotoxin?

Neurotoxins (such as Botox, Dysport, or Xeomin) are safe, FDA-approved injectable treatments designed to temporarily relax the specific facial muscles that cause expression lines. By "turning down the volume" on these muscle contractions, we can smooth out existing wrinkles and prevent new ones from forming.

Key Benefits

- **Softens Expression Lines:** Instantly improves the look of "frown lines" (between the brows), "crow's feet" (around the eyes), and horizontal forehead creases.
- **Prevents Future Wrinkles:** By relaxing the muscles, you stop the repetitive movements that etch deep lines into your skin over time.
- **Natural-Looking Results:** Expert application ensures you still look like *you*—just well-rested, refreshed, and smooth.
- **Quick & Convenient:** Often called a "lunchtime treatment," the procedure takes only about 15–20 minutes with zero downtime.

How It Works

1. **Consultation:** We evaluate your facial anatomy and discuss your aesthetic goals to create a customized treatment plan.
2. **Precision Injection:** Your provider uses a tiny, ultra-fine needle to place the neurotoxin into specific, targeted muscles.
3. **The "Refresh":** Over the next 3 to 14 days, you will notice the targeted muscles relaxing, resulting in a smoother, more youthful appearance.

Quick Facts

- **Downtime:** None! You can return to your day immediately after your appointment.
- **Longevity:** Results typically last **3 to 4 months**.
- **Safety:** Millions of treatments are performed safely every year by qualified medical professionals.
